

SETU

Two people. Nobody in the middle.

Security-first messaging that works on weak or no internet — and the same RNKE recognition kernel as a firewall for AI-agent actions.

Celextrix Private Limited · Delhi · August 2026 · Patent (PCT) filed

The problem

1

Identity is rented

Phone number, account, platform — you can be locked out, and every messenger knows your whole graph.

2

Networks drop

Mountains, villages, borders, disasters: when the link goes, today's apps stop; when it returns, messages arrive late, twice, or out of order.

3

Carriers can read or lie

SMS, couriers, local relays carry plaintext or need trust; "delivered" ticks come from a server, not the person.

What SETU does

1

Mutual connect

Scan each other's QR. A key on the phone is the identity — no SIM, no account, no server that stores who knows whom. One-sided contact cannot exist.

2

Sealed envelope, any carrier

Every message is signed and sealed for the recipient only. Send it over WhatsApp, SMS, Bluetooth, a file, a village Wi-Fi relay box, or a person walking — the carrier sees ciphertext.

3

Late is not wrong

Causal ordering (parent state, not the clock), replay and tamper rejection, and a signed receipt from the receiver — proof the person got it, not a server tick.

Works with no internet — three levels

Level 1 • Any carrier

SMS • Bluetooth / Nearby • .setu file on SD card • WhatsApp — shipped, live today

Level 2 • Village relay box

₹3–5k Raspberry Pi hotspot: blind store-and-forward, syncs when it sees internet — software + Pi installer shipped

Level 3 • Courier / mesh

Phones carry sealed mail for others; multi-hop, loop-safe, bounded — core + courier mode shipped, radio transport next

"Beech mein koi nahi. Rasta chahe jo ho, rasta padh nahi sakta."

Second product: RNKE Agent Firewall

1

The AI-agent problem

AI agents now move money, deploy code, delete data and send mail. Today there is no standard gate that proves identity, intent, evidence and authorization BEFORE an irreversible action. One bad prompt = one real loss.

2

Propose → verify → certificate → execute

Every agent action is a sealed proposal. The recognition kernel verifies who, what, on what evidence, with what authority, and rejects replays. Default DENY; the action runs only when a finite certificate closes; a chained receipt records it.

3

Live demo today

Agent Firewall demo is running (replit.app/api/firewall). Same code that gates SETU messages gates machine actions — one trust grammar for humans and agents. Target: fintech, DevOps, enterprise AI ops.

What exists today (not slides)

LIVE

Web demo — two phones, nothing to install

0 / 4

Public red-team page: four real attacks, none succeed

11/11 · 7/7 · 8/8

Kernel adversarial suite · relay suite · mesh sims — all pass

17 Aug 2026

First real handshake on record, receipt pinned

Android app in use by a small group · Play Store build ready · village-relay + Pi installer · RNKE Agent Firewall demo (AI-action gate). Crypto is standard (Ed25519 / X25519 / AES-GCM); our contribution is the trust grammar. Not yet independently audited — stated plainly.

Business model

1

1 • Agent Firewall — B2B SaaS

Per-agent / per-action licence for enterprises running AI agents (fintech, DevOps, BPO). Pilot ₹5–15 L/yr per customer; self-hosted tier for banks and government. Fastest revenue — no hardware, no field trial.

2

2 • SETU Enterprise — per-seat + relay

Private secure-channel deployment for institutions, disaster cells, defence (via iDEX/DAP) and border-area organisations:
₹200–500/seat/month + relay box (₹3–5k hardware, margin) + on-prem relay licence. Audit is the gate; funded in year 1.

3

3 • Kernel licensing + services

RNKE patents (3 PCT) licensed to OEMs and messenger/ledger vendors; integration and security-review services. SETU consumer app stays free — trust layer is the product, not ads. 12-month plan: ₹50 L in 3 tranches → first paying pilot by month 9.

The ask

1

Field pilot

50 phones · 30 days · one low-connectivity site. We bring software, relay boxes, support; partner brings site + evaluation. Metrics agreed up front.

2

Security review

Adversarial review of the protocol grammar; findings fixed and credited publicly.

3

Prototype grant

Ruggedised relay box + Android radio mesh + independent audit — 12-month milestones, ~₹70 L.
